Description

The JUMBO Railway for platform is specially designed in accordance with current safety regulations for installing railings on platforms before they are accessed for further assembly of frames and railings. This system ensures that the work is performed safely and efficiently, as the railway is installed from the underlying platform. The process involves first securing one post of the railway to the frame, then sliding the entire railing up while fastening the other post to the opposite side of the frame. Once the railway is in place, the platform can be safely accessed, and the further assembly of frames and railings can proceed. This railway is an indispensable part of a safe scaffold setup.
